

1.3 Financial applications of geometric sequences

Number and algebra · IB Diploma · Concept guide and original exam-style practice

Understand the concept

Compound interest is modelled by a geometric sequence: an amount P invested at nominal annual rate $r\%$, compounded k times per year for n years, grows to $FV = P(1 + r/(100k))^{(kn)}$. Depreciation uses the same structure with a rate less than 1 (value multiplied by $(1-r/100)$ each period). These are direct financial uses of $u_n = u_1 \cdot r^{(n-1)}$ type growth/decay.

Worked example: follow the reasoning

\$2000 is invested at 6% p.a. compounded monthly for 4 years. Find the final value.
 $FV = 2000(1 + 0.06/12)^{(12 \times 4)} = 2000(1.005)^{48} = 2000(1.2705) = \2541.03 (2 d.p.)

Quick check · multiple choice

A car worth \$30000 depreciates at 15% per year. What is its value after 2 years?

- A \$21675
- B \$25500
- C \$19200
- D \$22950

Write your choice: _____

Structured practice

Answer in the space provided. Show working and units where relevant.

- 1 An investor deposits \$5000 into an account paying a nominal annual interest rate of 4.8%, compounded quarterly. [6]
- (a) Find the value of the investment after 5 years.
 - (b) Find the minimum number of whole years needed for the investment to exceed \$7000.

Final answer: _____

Answers and explanation

Question 1 [6]

(a) $FV = 5000(1 + 0.048/4)^{(4 \times 5)} = 5000(1.012)^{20} = 5000(1.2682) = \6341.15 .

(b) Need $5000(1.012)^{(4n)} > 7000 \rightarrow (1.012)^{(4n)} > 1.4 \rightarrow 4n \cdot \ln 1.012 > \ln 1.4 \rightarrow 4n > 28.24 \rightarrow n > 7.06$, so $n = 8$ years.

Quick check answer

A. $30000 \times 0.85^2 = 30000 \times 0.7225 = \21675 .

Self-assessment

Compare each credited step with your own answer. Fix the first reasoning or content error, then retry the practice question without looking at the solution.
