

1.5 Complex numbers (HL)

Number and algebra · IB Diploma · Concept guide and original exam-style practice

Understand the concept

A complex number $z=a+bi$ has real part a and imaginary part b , where $i^2=-1$. In polar/Euler form $z=r(\cos\theta+i\sin\theta)=r\cdot e^{i\theta}$, where $r=|z|=\sqrt{a^2+b^2}$ is the modulus and $\theta=\arg(z)$ is the argument. Multiplication/division are easiest in polar form (moduli multiply/divide, arguments add/subtract). De Moivre's theorem states $z^n = r^n(\cos n\theta + i\sin n\theta)$, used for powers and finding n th roots.

Worked example: follow the reasoning

Find $(1+i)^4$ using De Moivre's theorem.

$1+i$ has $r=\sqrt{2}$, $\theta=\pi/4$.

$$(1+i)^4 = (\sqrt{2})^4(\cos(4\cdot\pi/4)+i\sin(4\cdot\pi/4)) = 4(\cos\pi + i\sin\pi) = 4(-1+0i) = -4.$$

Quick check · multiple choice

What is the modulus of $z = 3-4i$?

- A 1
- B 5
- C 7
- D 25

Write your choice: _____

Structured practice

Answer in the space provided. Show working and units where relevant.

1 Let $z_1 = 2+2i$.

[8]

- (a) Write z_1 in the form $r(\cos\theta+i\sin\theta)$, giving exact values of r and θ .
- (b) Hence find z_1^6 in Cartesian form $a+bi$.
- (c) Find the two square roots of -4 in the form $a+bi$.

Final answer: _____

Answers and explanation

Question 1 [8]

- (a) $r = \sqrt{4+4} = 2\sqrt{2}$, $\theta = \arctan(2/2) = \pi/4$. So $z_1 = 2\sqrt{2}(\cos(\pi/4) + i\sin(\pi/4))$.
(b) $z_1^6 = (2\sqrt{2})^6(\cos(6\pi/4) + i\sin(6\pi/4)) = 512(\cos(3\pi/2) + i\sin(3\pi/2)) = 512(0-i) = -512i$.
(c) $-4 = 4(\cos\pi + i\sin\pi)$. Square roots: $\sqrt{4}(\cos(\pi/2 + k\pi) + i\sin(\pi/2 + k\pi))$ for $k=0,1 \rightarrow$
 $2(\cos(\pi/2) + i\sin(\pi/2)) = 2i$, and $2(\cos(3\pi/2) + i\sin(3\pi/2)) = -2i$.

Quick check answer

B. $|z| = \sqrt{3^2 + 4^2} = \sqrt{25} = 5$.

Self-assessment

Compare each credited step with your own answer. Fix the first reasoning or content error, then retry the practice question without looking at the solution.
