

4.5 Discrete random variables and the binomial distribution

Statistics and probability · IB Diploma · Concept guide and original exam-style practice

Understand the concept

A discrete random variable X takes a countable set of values, each with probability $P(X=x)$, where $\sum P(X=x)=1$. Its expected value $E(X)=\sum x \cdot P(X=x)$ and variance $\text{Var}(X)=E(X^2)-[E(X)]^2$. The binomial distribution $X \sim B(n,p)$ models the number of successes in n independent trials each with success probability p : $P(X=x) = {}^nC_x \cdot p^x \cdot (1-p)^{n-x}$, with $E(X)=np$ and $\text{Var}(X)=np(1-p)$.

Worked example: follow the reasoning

$X \sim B(8, 0.3)$. Find $P(X=3)$ and $E(X)$.

$$P(X=3) = {}^8C_3 (0.3)^3(0.7)^5 = 56 \times 0.027 \times 0.16807 = 56 \times 0.004538 = 0.254 \text{ (3 s.f.)}$$

$$E(X) = np = 8(0.3) = 2.4.$$

Quick check · multiple choice

$X \sim B(10, 0.4)$. What is $\text{Var}(X)$?

- A 4
- B 2.4
- C 6
- D 1.55

Write your choice: _____

Structured practice

Answer in the space provided. Show working and units where relevant.

- A discrete random variable X has probability distribution given by $P(X=0)=0.2$, $P(X=1)=k$, $P(X=2)=0.35$, $P(X=3)=0.15$. [8]
 - Find the value of k .
 - Find $E(X)$.
 - A binomial variable $Y \sim B(20, 0.25)$ models a separate scenario. Find $P(Y=5)$ and $E(Y)$.

Final answer: _____

Answers and explanation

Question 1 [8]

(a) Sum to 1: $0.2+k+0.35+0.15=1 \rightarrow 0.7+k=1 \rightarrow k=0.3$.

(b) $E(X)=0(0.2)+1(0.3)+2(0.35)+3(0.15) = 0+0.3+0.7+0.45 = 1.45$.

(c) $P(Y=5)=20C5(0.25)^5(0.75)^{15} = 15504 \times 0.0009766 \times 0.01336 \approx 15504 \times 0.00001305 \approx 0.2023$. $E(Y)=np=20(0.25)=5$.

Quick check answer

B. $\text{Var}(X)=np(1-p)=10(0.4)(0.6)=2.4$.

Self-assessment

Compare each credited step with your own answer. Fix the first reasoning or content error, then retry the practice question without looking at the solution.
