

5.8 Further integration: substitution and by parts (HL)

Calculus · IB Diploma · Concept guide and original exam-style practice

Understand the concept

Integration by substitution reverses the chain rule: for $\int f(g(x))g'(x)dx$, let $u=g(x)$, $du=g'(x)dx$, transforming the integral into $\int f(u)du$. Integration by parts reverses the product rule: $\int u dv = uv - \int v du$, useful for integrands that are a product of functions (e.g. $x \cdot e^x$, $x \cdot \ln x$), typically choosing u to be the factor that simplifies upon differentiation.

Worked example: follow the reasoning

Find $\int 2x(x^2+1)^4 dx$ using substitution.

Let $u=x^2+1$, $du=2x dx$.

$$\int 2x(x^2+1)^4 dx = \int u^4 du = u^5/5 + C = (x^2+1)^5/5 + C.$$

Quick check · multiple choice

Using integration by parts on $\int x \cdot e^x dx$, a suitable choice is:

A $u=e^x$, $dv=x dx$

B $u=x$, $dv=e^x dx$

C $u=xe^x$, $dv=dx$

D Substitution is required instead

Write your choice: _____

Structured practice

Answer in the space provided. Show working and units where relevant.

- 1 (a) Use substitution to find $\int x\sqrt{x^2+9} dx$.
(b) Use integration by parts to find $\int x \cdot \ln(x) dx$.

[8]

Final answer: _____

Answers and explanation

Question 1 [8]

(a) Let $u=x^2+9$, $du=2x \, dx$, so $x \, dx = du/2$.

$$\int x\sqrt{x^2+9}dx = \int \sqrt{u} \cdot (du/2) = (1/2)\int u^{1/2}du = (1/2)(2/3)u^{3/2}+C = (1/3)(x^2+9)^{3/2}+C.$$

(b) Let $u=\ln(x)$, $dv=x \, dx$, so $du=(1/x)dx$, $v=x^2/2$.

$$\int x \ln(x)dx = (x^2/2)\ln(x) - \int (x^2/2)(1/x)dx = (x^2/2)\ln(x) - \int (x/2)dx = (x^2/2)\ln(x) - x^2/4 + C.$$

Quick check answer

B. Choosing $u=x$ (which simplifies to 1 upon differentiation) and $dv=e^x \, dx$ (easily integrated) makes integration by parts straightforward.

Self-assessment

Compare each credited step with your own answer. Fix the first reasoning or content error, then retry the practice question without looking at the solution.
