

2.1 Linear models

Functions · IB Diploma · Concept guide and original exam-style practice

Understand the concept

A linear model $y=mx+c$ describes a constant rate of change: m is the gradient (change in y per unit increase in x) and c is the y -intercept (value of y when $x=0$). Linear models are built from a rate and a fixed/starting value, or fitted to two data points, and used to predict values within a sensible domain for the context. Extrapolating far beyond the data used to build the model carries risk, since the true relationship may not stay linear.

Worked example: follow the reasoning

A plumber charges a callout fee of \$45 plus \$30 per hour worked. (a) Write a linear model $C(h)$ for the total cost in terms of hours worked h . (b) Find the cost of a 3.5 hour job.
Solution: (a) $C(h)=45+30h$. (b) $C(3.5)=45+30(3.5)=45+105=\150 .

Quick check · multiple choice

A line passes through (2,7) and (5,16). What is its gradient?

- A 2
- B 3
- C 4.5
- D 9

Write your choice: _____

Structured practice

Answer in the space provided. Show working and units where relevant.

- 1 A car rental company charges a fixed fee of \$60 plus \$0.25 per km driven. (a) [5]
Write a linear model $C(d)$ for the total cost in terms of distance driven, d km. (b) A customer's bill is \$145. Find the distance driven. (c) State a suitable restriction on the domain of d in this context.

Final answer: _____

Answers and explanation

Question 1 [5]

(a) $C(d)=60+0.25d$. (b) $145=60+0.25d \rightarrow 85=0.25d \rightarrow d=340$ km. (c) $d \geq 0$ (realistically also bounded above by the vehicle's range/rental period).

Quick check answer

B. Gradient = $(16-7)/(5-2) = 9/3 = 3$.

Self-assessment

Compare each credited step with your own answer. Fix the first reasoning or content error, then retry the practice question without looking at the solution.
